Thermal & Fluids Analysis Workshop TFAWS 2017 August 21-25, 2017 NASA Marshall Space Flight Center Huntsville, AL

Agenda

- Background
- Analysis Objectives
- Approach
- Analyses
 - Spin Motor Plume Impingement Environments
 - Main SRM Plume Induced Environments
- Conclusions & Lessons Learned

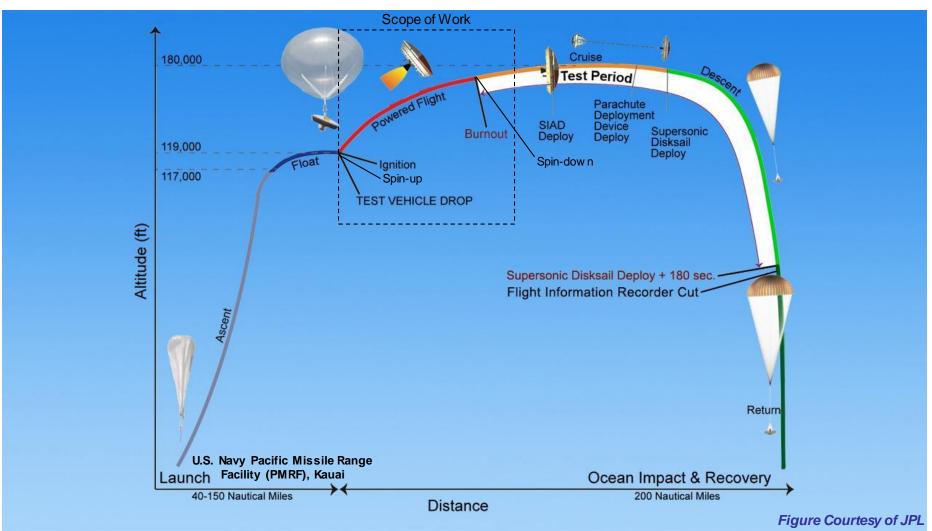

- LDSD Supersonic Flight Dynamics Tests (SFDT-1, 2)
 - Test supersonic deceleration technologies in Earth's upper stratosphere, SFDT-1: June 28, 2014, SFDT-2: June 8, 2015
 - Balloon launched test vehicle, accelerated using a solid rocket motor (SRM) to achieve freestream test conditions (simulate Mars entry)
 - SFDT-1 & 2 Deceleration Technologies
 - Supersonic Inflatable Aerodynamic Decelerator Robotic class (SIAD-R)
 - Parachute Deployment Device (PDD) Ballute Parachute extraction
 - Supersonic Disk Sail (SFDT-1), Ring Sail (SFDT-2) Parachutes
- Marshall Space Flight Center EV33 Aerosciences Roles
 - Program onset provide plume induced heating predictions throughout powered flight (main solid)
 - Spin motor plume impingement (heating and impact pressures)
 - Plume induced aerodynamics predictions (post-SFDT-1/pre-SFDT-2)

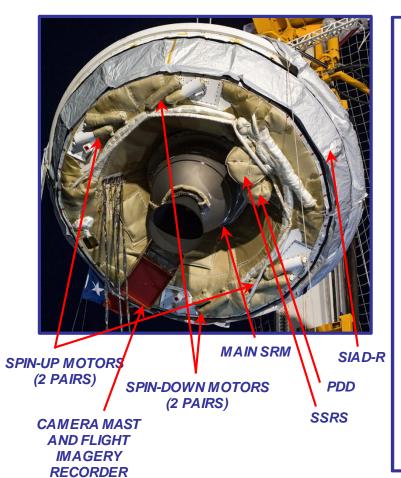

Full Scale Testing in Earth's Stratosphere – Simulating Mars Entry

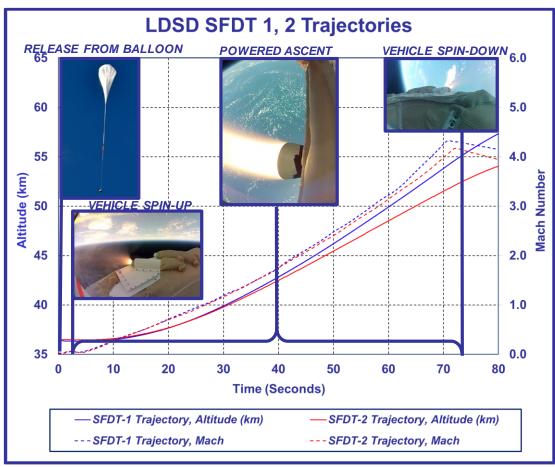

LDSD Test Vehicle and Trajectories^{1,2} (Best Equivalent)

Orbital-ATK Star-48B Long Nozzle Solid Rocket Motor ³						
Expansion Ratio (A/A*)	54.8 (47.2 avg. nozzle erosion)					
Throat Diameter	3.98 in / 10.11 cm					
Exit Diameter	29.5 in / 74.93 cm					
Nozzle Length	35.8 in / 90.93 cm					
Chamber Pressure	Approximately 600 PSIA (@ t=0 sec)					
Propellant (Approx. % Weight)						
71%	Ammonium Perchlorate					
11%	Hydroxyl Terminated Polybutadiene (HTPB)					
18%	Aluminum					
Duration: Offloaded approx. 20% (400kg) to reduce burn time from 84 to 68 secs						

Nammo Talley, Inc. Solid Rocket Spin Motor					
Expansion Ratio (A/A*)	6.47				
Throat Diameter	0.86 in / 2.2 cm				
Exit Diameter	2.2 in / 5.59 cm				
Nozzle Length	1.82 in / 4.63 cm				
Chamber Pressure	Approximately 3057 PSIA				
Propellant (Approx. % Weight)					
83% Ammonium Perchlorate	1.5% Aluminum				
9% HTPB	1.5% Fe ₂ O ₃				
5% Plasticizer					
Duration: 0.25 secs					

Analysis Objectives

- 2012–2013 LDSD Thermal Design Support
 - Star 48 Plume Induced Base Heating
 - Radiation heat flux from Al₂O₃ particles and plume gases
 - Convection from plume-air recirculation
 - Spin Motor Plume Impingement
 - Predict plume heating from convection and Al₂O₃ particle impingement
 - Plume induced forces & moments (spin performance)
 - Primary concerns, impingement heating on SIAD, parachute bridles and mast cameras and instrumentation
- 2014–2015 Plume Induced Aerodynamics Support
 - Predict aerodynamic coefficients (forces & moments) during subsonic and transonic powered flight
 - Investigate plume flow field modeling sensitivities to aerodynamics

Approach

- Simulate plumes throughout a flight trajectory at discrete points in time in a quasi-steady fashion
 - Two step approach, nozzle flows using engineering codes
 - Nozzle solutions used as boundary conditions to CFD domain
- Nozzle Flow Field
 - Model chamber and nozzle flow field chemistry using the NASA
 Glenn Chemical Equilibrium Combustion^{4,5} (CEC) program
 - Model two-phase nozzle flow, core and boundary layer, using the Reacting and Multiphase Program⁶ (RAMP2) & Boundary Layer Integral Matrix Procedure⁷ (BLIMPJ) eng. codes (MOC codes)
- CFD (induced forces & convection) Loci-CHEM⁸⁻¹⁴ 3.3 p4
- Spin Motor Plume Particle Heating PLIMP¹⁵ eng. code
- Plume Radiation (sep. series of plume solutions, Star 48)
 - RAMP2 & SPF3^{16,17} Gas and Al²O³ particle plume flow field
 - Reverse Monte Carlo¹⁸⁻²⁰ Particle, gaseous band model code

Computational Grid

CFD Grid Challenges

- Approach Generally, try to create one grid to accommodate many cases, opposed to #grids refined for each case
- Variation of motor firing configurations (2, 4)
 - 1 spin-up and 1 spin-down grid to suit case
 - Tailored surface geometries per spin motor impingement, removed protuberances "behind motors"
- Variable angles of attack
- Subsonic / supersonic free stream conditions (shock refinement, aspiration refinement/convergence)

Grid Generation

- ANSA 14, Solid Mesh 5.9.9²¹ Surface Grids, Volume Setup
- AFLR3²² Unstructured Volume Grids

Approach

Summary of CFD Settings, RANS

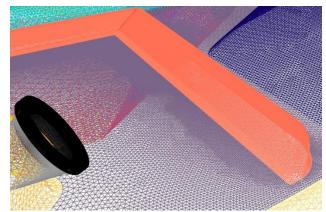

Category	Model Setup					
Case Description	Spin-Up Motors	Spin-Down Motors	Star48B Motor			
Number of Plumes Simulated	4 (all on) and 2 (1				
Angle-of-Attack, α, and Side-Slip, β, Angles	$\alpha = 163^{\circ}, \beta = 0^{\circ}$	$\alpha = 0^{\circ}, \beta = 0^{\circ}$	Various, per trajectory			
Plume Chemistry	Frozen					
No. Species	2 - Equivalent air & plume gas					
Thermodynamic and Transport Properties						
Specific Heat, Cp Thermally perfect gas, specie Cp varies with temperature, p						
Viscosity and Conduction Models	Transport Fit (equivalent μ(T), k(T), per specie)					
Diffusion Model	Laminar-Schmidt					
Particle Model			Aluminum-Oxide			
Туре	No	Lagrangian (1 Case)				
Number of Particle Bins & Sizes		5, 1.662 - 4.557µm				
Turbulence Model	Menter's Shear Stress Transport, SST					
Compressibility Correction	Sarkar					
Urelax (m/s)	0.10					
Dt Max (sec)	Varied per case, generally 0.001 - 0.0001 sec					
Accuracy	2nd Order, steady-state solutions					
Surface Boundary Conditions	No slip, vehicle spin rate applied					
Wall Temperatures	255, 973	255, 973, 1773 K				
Vehicle Spin Rate	e 0 50 (RPM)					
Internal Nozzle Wall Thermal	Adiabatic Wall (Carbon Phenolic)					
Solver	Guass-Seidel					

Spin-Up Motor Surface Mesh (Final Iteration, 174M)

INITIAL ANALYSIS

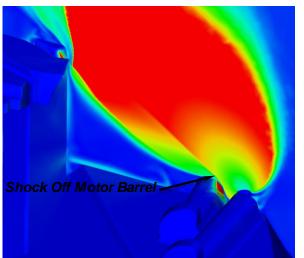

SPIN-UP - 120 Kft (36.6 km), P_∞= 0.72 PSIA (499 Pa) - ALL SPIN-UP MOTORS "ON"

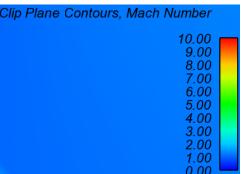

Outboard Plume Inboard Plume Inboard Plume

Solution Plane Contours

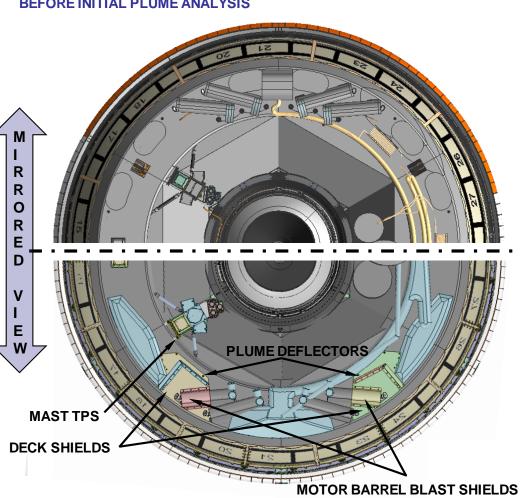

- Initial Spin Motor Plume Impingement Summary
 - Motor casings, bridle coverings severe heating areas, peak heat rates in excess of 500 BTU/ft²sec (568 W/cm²)
 - Camera mast, peak heat rates in excess of 200 BTU/ft²sec (170 W/cm²)
- Thermal and Operational Design Impacts
 - Two week "Tiger Team" to provide thermal protection options
 - Added plume deck blast shields, motor barrel shields and deflectors
 - Restricted height to prevent potential entanglement with chute brid. lines
 - Thermal protection (TPS) increased on camera mast (thin cork)
 - Staggered firing configurations (driven by flight dynamics, flight-ops as well)

BEFORE INITIAL PLUME ANALYSIS

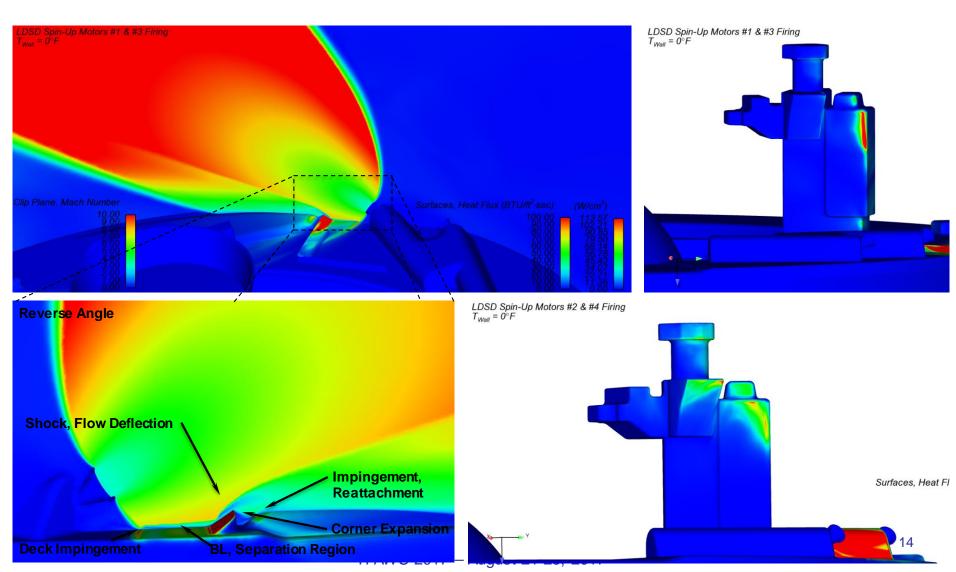

AFTER (MIRRORED PICTURE)

FOLLOW-UP ANALYSIS SPIN-UP - 120 Kft (36.6 km), P_{∞} = 0.72 PSIA (499 Pa) - STAGGERED FIRINGS

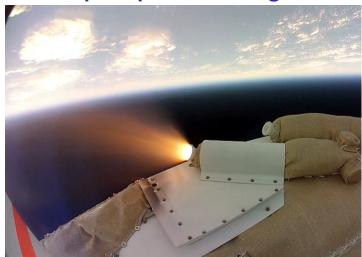

Spin Motor Results

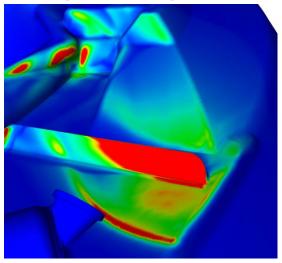

SFDT-1 June 28, 2014

Spin-Up Motor Firings

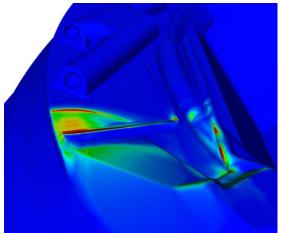

Pre-flight Heating Contours

Post-flight Charring

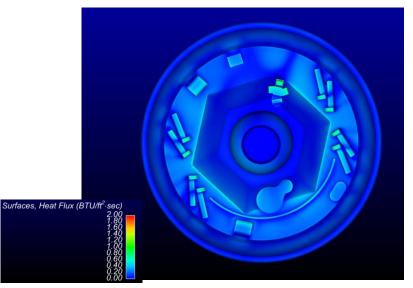

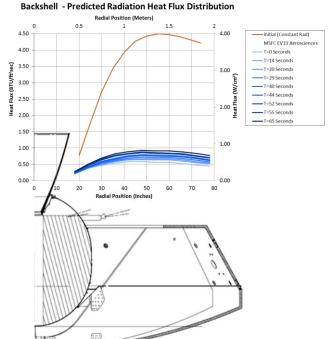

- Pre-SFDT-1 Star 48 plume induced heating environments
 - Predicted radiation rates approximately a factor of 4 less than initial
 - Predicted base pressure coefficient always negative, predicted convective heat rates generally <1 BTU/ft²sec

 No thermal issues, very benign, highest temperatures were recorded on the Star 48 motor case (282 C, driven by internal any ironment)

environment)

Pre-SFDT-1 Convective Heating Prediction, 151Kft

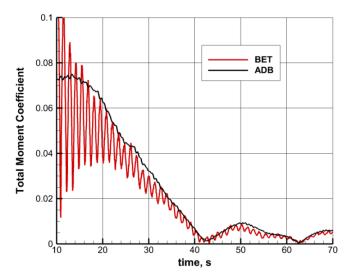

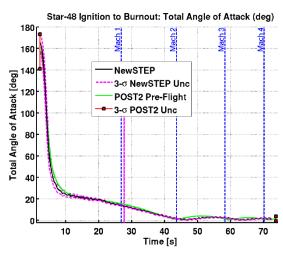

- SFDT-1 flight reconstruction revealed the test vehicle over shot the targeted altitude approximately 10Kft
 - No chamber pressure measurements, no distinct way to accurately decoupling thrust and drag (challenge on determination of C_A)
 - Thrust reconstruction analysis revealed slightly over performing solid and over prediction of plume induced drag
 - Over predicted total moment (pitch-yaw) coefficient, resulting in the vehicle lofting more than expected

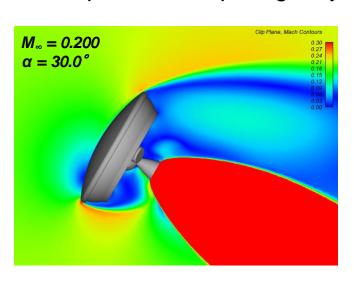

- LDSD plume induced base flow field is different than "traditional" launch vehicles and missiles
 - 1. Blunt body Realm of historical launch vehicles and missiles have a large slenderness ratio, where there is considerable running length to allow the development of a thick boundary layer that enters the base
 - Ratio of base-to-nozzle exit area free stream expansion angle entering the base, relative base eddy scale. Aft cavity provides recovery volume that affects the base environment
 - 3. Variation in total alpha due to spin/flight dynamics

Grid Evolution – Star 48

Initial Grids, Pre-SFDT-1 Heating (41 - 90 million cell, 2013)

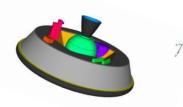

Predominantly supersonic cases, 1.1 < M_{\odot} < 4.3, need higher q_{\odot} for recirculation Simple geometry & trajectory (α_{total} =0°, small vol. O ~ 0.1 km³)

Primary objective, resolve forward shock, plume induced base recirc. (avg heating)

Post-SFDT-1 (90, 136 million, 2014)

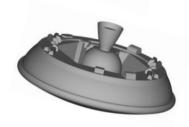

Sub, transonic cases (M_{∞} = 0.5 - 1.2, "larger" vol. O ~ 1 km³) Two geometries, reconstructed traj. subset (α , β = 0, 10, 20°) Multiple Models – Plume w/wout particles, hybrid RANS/LES (423M) Objective, predict plume induced aero. forces & moments

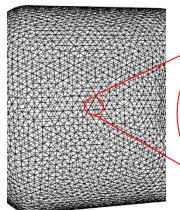

Pre-SFDT-2(191 million, 2015)

Sub, transonic cases ($M_{\infty}=0$ - 1.2 "larger" vol. $O \sim 1 \text{ km}^3$) Reconstructed trajectory subset (α , β = 10 - 40°)

Increase grid to accommodate ≥40° cases, seek grid convergence

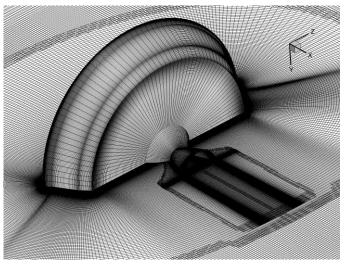

Туре	Grid Cells (M)	Mach	α (deg)	CA	%∆CA _{ABS}

SFDT-2

- Flight Instrumentation
 - Star 48 chamber pressure, Kulite pressure transducer
 - Star 48 performance, thrust reconstruction
 - Tavis (2) pressure transducers (0-0.137 psia)
 - Base pressure, aero model CFD validation

Kulite pressure transducer

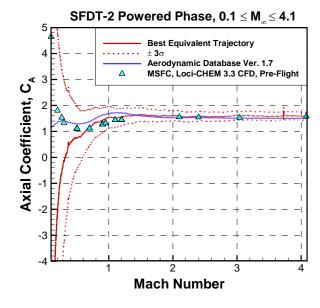

Tavis pressure transducers

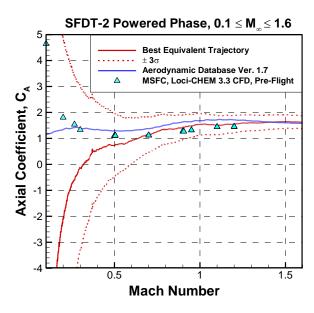

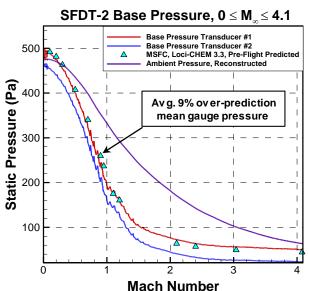

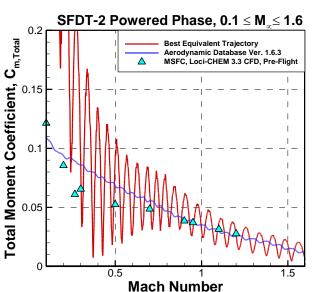

Impacts & Results

Conclusions & Lessons Learned

- Plume induced environments all thermal requirements met²⁴, robust thermal design validated, Star 48 power-on aerodynamic data base updated (ready for potent. SFDT-3)
- Highly under expanded plume interactions can be significant
 - Degree of expansion, plume size, can lead to a variety of consequences!
 - Observed similar plume induced environment issues with sep. motors
 - Get plume modeling involved early in the analysis cycle
- Better understanding of the modelling sensitivities associated with single engine, plume induced base flow, in regards to the development of base eddy structure
 - Cavity geometry provided greater base pressure recovery, recirc. vortex interaction with base (similarly observed in base eddy studies)
 - Forward BL separation point, affects the point of impingement on Star 48 plume, momentum transfer interaction between base eddy and BL
 - Angle of attack, relative exposed plume area to the freestream
 - Match all nozzle exit conditions as best as possible
